APPLICATIONS / DATA BASE / BROWSER / / INTERNET / WEB / NEWS / BOOKS

The present paper has by intention to share two experiences of development using the WIXS and WWWISIS tools for solutions of information management.

One of them was made for the *Niños del Milenio* project (<http://www.ninosdelmilenio.org>) from the *Save the Children* foundation first; and afterwards, from GRADE. Mainly, they needed to store and distribute information that was important for the works and investigations in the press media. Each note or article had to be registered under certain categories (intern thesaurus) with a summary and key words. The application had to present modules for the elaboration of newspaper's reports which contained statistics. The user would accede through different modules, simple and specific ones, by indexes; having the possibility, finally, of opening the same note or article in its digital version. Additionally, it had to be prepared similar modules to work with books, magazines and files. The access had to be personalized according to the identification of each user.

The other experience was used for the *Editorial Santillana*, in Peru. They needed a complete library system in a web media; predefined searches in function to the areas that includes the company and the material that each of them requested (access by dates, collections, topics, events, countries, etc.). The access had to be easy and direct. Presenting intern modules for the loan and return of the books, with their respective statistic. Also, options were prepared for tags printing and reports generating to identify the available material and to make inventories.

In the following pages we present the details of the solutions that were applied for each of these cases.
